

Cold Weather Tips from Whiteland Water Works

Every winter season, the pipes in your home are at risk of damage from freezing conditions. Low temperatures can cause your water pipes to freeze, and in some cases, burst. The following tips can help you safeguard your home before, during and after a pipe freezes.

Prevent Your Pipes From Freezing:

- Disconnect all gardening hoses and install covers on all outside faucets/spigots.
- Keep your house temperature at 68 degrees or higher, even if you're leaving the house for an extended period.
- Open cabinet doors below sinks to allow heat from the home to circulate.
- Identify the location of your main water valve and the valve of your water heater. (This may come in handy during an emergency.)
- Wrap pipes nearest exterior walls and in crawl spaces with pipe insulation or with heating tape. This can prevent freezing, especially for interior pipes that run along outside walls.
- Close all windows near water pipes, cover or close open-air vents. Freezing temperatures combined with wind drafts can cause pipes to freeze more frequently.
- Heat your basement and consider weather sealing your windows.
- Insulate outside walls and unheated areas of your home.
- If you plan to be away from home for an extended period, shut off water supply valves to your washing machine.

Monitor Freezing Pipe Conditions:

- Allow a faucet to drip slightly (lukewarm water) in order to minimize freezing.
- The first sign of freezing is reduced water flow from a faucet.
- Check your faucets for water flow and pressure before you go to sleep and again when you wake up.
- Check pipes in unheated areas, near exterior walls and in crawl spaces. These tend to be vulnerable to freezing conditions.
- Identify cold air drafts coming in from a flue or chimney chase and caulk gaps that are near pipes.

If a Pipe Freezes:

- If a faucet or pipe inside your house freezes, you can thaw it using a good hair dryer. For safety reasons, DO NOT operate a hair dryer near standing water.
- To thaw a frozen pipe- heat water on the stove, soak towels in the hot water and wrap them around the cold sections of the pipes.
- When thawing a pipe, start thawing it nearest to the faucet. Make sure the faucet is turned on slightly so that the melted water can drip out.
